TD-00036

CROSS REFERENCE FOR HOLLOW METALLIC WAVEGUIDES

1 Introduction

This document cross-references the designations of common waveguides with ordinary rectangular, reduced-height rectangular, square, circular, and double ridge cross section. In addition to standard-compliant waveguide designations, this document provides inner dimensions (without corner radii and tolerances), nominal frequency ranges, cut-off frequencies and letter frequency band designations.

The standards highlighted in gray are either cancelled ([3], [11], [15], [16], [17]) or withdrawn and not superseded ([2], [14], [18]). Nevertheless, the waveguide designations defined therein are still in use.

3 Document Revision Control

Issue	Date	Description
P	2020-06-04	- Start of the document revision control. Chapter numbers have been changed accordingly. - A few dimensions of the double ridge waveguides WRD 420U24, WRD 200D24, WRD 475D24 have been corrected and Ref. [16] has been changed back from MIL-W-23351/4C to its predecessor /4B.
Q	2020-08-26	- Circular waveguides with preferred sizes have been revised and supplemented according to IEC 60153-4:2017. - Circular waveguides with intermediate sizes have been amended according to IEC 60153-4:1973. - Minor editorial changes have been made.
R	2020-09-11	- Chapter 4: Waveguides R 35, R 41, and R 3.2K to R 26K from IEC 60153-2: 2016 have been added. - Minor editorial changes have been made.
S	2022-09-09	- Chapters 8 and 9 have been revised and supplemented to bring them into line with IEC 60153-4:2022. - Minor editorial changes have been made.

* The nominal frequency range is from approximately 1.25 to 1.9 times the TE_{10} cut-off frequency.
** The TE_{10} cut-off frequency is given by $f_c = c_0/(2a)$ with $c_0 = 299792458$ ms^{-1} and the waveguide width *a*.
*** The WR 7 waveguide per EIA [2] is sometimes misleadingly referred to as WR-06 (e.g. in [6]).
**** The internal dimensions of this waveguide differ slightly from those of the corresponding R waveguide.
***** Bold characters indicate classic band designations. Standard characters indicate other common band designations.
The waveguide designation marked in red (R 26K) had to be corrected by the author because the designation given in the standard [1] is obviously wrong.

* The waveguide designations listed here, e.g. “1/2 WR 90”, are composed of the EIA designations as per [2] and the prefix “½” to indicate a bisection of the original heights. Other common designations are “WR 90 Half Height” and “WR 90 H/H”.

** The nominal frequency range is from approximately 1.25 to 1.9 times the TE_{10} cut-off frequency.

*** The TE_{10} cut-off frequency is given by $f_c = c_0/(2a)$ with $c_0 = 299792458$ ms^{-1} and the waveguide width a.

**** Bold characters indicate classic band designations. Standard characters indicate other common band designations.

The preferred waveguide types are highlighted in gray, while the intermediate sizes are without highlighting.

10 Circular waveguides (proprietary sizes) for frequencies of 100 GHz and above

For circular waveguides intended for frequencies of 100 GHz and above, various companies (e.g. Cernex, Custom Microwave, Ducommun, Millitech, Quinstar, SPINNER, TRG) have defined proprietary waveguide sizes in the past. Over the years, these have developed into a quasi-standard. The following table lists the most used sizes of these proprietary waveguides. The waveguide designation used here follows the well-established EIA designation scheme [14]. Bold printed values of the inner diameter indicate the original unrounded values.

Waveguide designations				**Inner diameters**		**Frequencies**

* The nominal frequency range is from approximately 1.15 times the TE_{11} cut-off frequency to 0.95 times the TE_{21} cut-off frequency.

** The TE_{11} cut-off frequency is given by $f_c = 1.8412\ c_0/(\pi d)$ with $c_0 = 299792458$ ms^{-1} and the waveguide diameter d.

*** The TM_{01} cut-off frequency is given by $f_c = 2.4048\ c_0/(\pi d)$ with $c_0 = 299792458$ ms^{-1} and the waveguide diameter d.

**** The TE_{21} cut-off frequency is given by $f_c = 3.0542\ c_0/(\pi d)$ with $c_0 = 299792458$ ms^{-1} and the waveguide diameter d.
